

JavaDropbox

A self-hosted cloud storage platform built with Spring Boot, React and PostgreSQL.

Files are uploaded through a scratch file and renamed into place, so an interrupted upload never leaves a half-written file behind. Replacing a file keeps the old content as a version that can be restored in place or as a copy.

Folders download as ZIP archives streamed straight to the response, share links carry only a random token whose hash is stored, and every path a client sends is checked against the serving directory before anything touches the disk.

This PDF is shown by your browser's own viewer, in the app's preview dialog.
